CLOSEDNESS OF THE SOLUTION MAP FOR PARAMETRIC VECTOR EQUILIBRIUM PROBLEMS WITH TRIFUNCTIONS

JÚLIA SALAMON

In this paper we introduce new definitions of vector topological pseudomonotonicity to study the parametric vector equilibrium problems with trifunctions. The main result gives sufficient conditions for closedness of the solution map defined on the set of parameters. The Hadamard well-posedness of parametric vector equilibrium problems is also analyzed.

AMS 2010 Subject Classification: 49N60, 90C31.

Key words: parametric vector equilibrium problems with trifunctions, Vector topological pseudomonotonicity, Mosco convergence, Hadamard well-posedness.

1. INTRODUCTION

Bogdan and Kolumbán [3] gave sufficient conditions for closedness of the solution map defined on the set of parameters. They considered the parametric equilibrium problems governed by topological pseudomonotone maps depending on a parameter. In this paper we generalize this result for parametric vector equilibrium problems with trifunctions.

Let $X$ and $Y$ be Hausdorff topological spaces and $P$, the set of parameters, another Hausdorff topological space, $T : X \to 2^Y$ be a multi-valued mapping.

Generalized vector equilibrium problems (GVEP for short) are obtained from generalized equilibrium problems by considering trifunctions on $K \times D \times K$ into a real topological vector space $Z$ with an ordering cone. By an ordering cone $C \subset Z$ we mean that $C$ is a closed convex cone in $Z$ with $\text{Int} C \neq \emptyset$ and $C \neq Z$, where $\text{Int} C$ denotes the interior of $C$.

Let $f_p : X \times Y \times X \to Z$ be a trifunction. For a given $p \in P$, we consider the following problem (GVEP)$_p$:

Find a pair $(x_p, y_p) \in K_p \times T (x_p)$ such that

$$f_p (x_p, y_p, u) \in (- \text{Int} C)^c$$

for all $u \in K_p$,
where $(- \text{Int} C)^c$ is the complement of $- \text{Int} C$ in $\mathcal{Z}$ and $K_p$ is a nonempty subset of $X$. Such an $x_p$ will be called a strong solution of the problem $(GVEP)_p$ in the sense that $y_p$ does not depend on $u \in K_p$.

Let us denote by $S(p)$ the set of the strong solutions for a fixed $p$. Suppose that $S(p) \neq \emptyset$, for all $p \in P$. Some existence results for $GVEP$ are given in [7, 9, 10].

The paper is organized as follows. In Section 2, we recall the notions of the vector topological pseudomonotonicity and the Mosco convergence of the sets. Section 3 is devoted to the study of the closedness of solution map for parametric vector equilibrium problems with trifunctions. In the final section, we investigate the generalized Hadamard well-posedness of parametric vector equilibrium problems with trifunctions.

2. PRELIMINARIES

In this section, we will introduce two new definitions of the vector topologically pseudomonotone trifunctions with values in $\mathcal{Z}$. First, the definition of the suprema and the infima of subsets of $\mathcal{Z}$ are given. Following [1], for a subset $A$ of $\mathcal{Z}$ the suprema of $A$ with respect to $C$ is defined by

$$\text{Sup} A = \{z \in \bar{A} : A \cap (z + \text{Int} C) = \emptyset\}$$

and the infima of $A$ with respect to $C$ is defined by

$$\text{Inf} A = \{z \in \bar{A} : A \cap (z - \text{Int} C) = \emptyset\}.$$ 

For more details see [6].

Let $(z_i)_{i \in I}$ be a net in $\mathcal{Z}$. Let $A_i = \{z_j : j \geq i\}$ for every $i$ in the index set $I$. The limit inferior of $(z_i)_{i \in I}$ is given by

$$\text{Lim inf} z_i = \text{Sup}\left(\bigcup_{i \in I} \text{Inf} A_i\right).$$

Similarly, the limit superior of $(z_i)_{i \in I}$ can be defined as

$$\text{Lim sup} z_i = \text{Inf}\left(\bigcup_{i \in I} \text{Sup} A_i\right).$$

We will use the following result.

**Theorem 2.1** ([8, Theorem 2.1]). Let $(z_i)_{i \in I}$ be a net in $\mathcal{Z}$ convergent to $z$ and let $A_i = \{z_j : j \geq i\}$.

i) If there is an index $i_0$ such that, for every $i \geq i_0$, there exists $j \geq i$ with $\text{Inf} A_j \neq \emptyset$, then $z \in \text{Lim inf} z_i$.

ii) If there is an index $i_0$ such that, for every $i \geq i_0$, there exists $j \geq i$ with $\text{Sup} A_j \neq \emptyset$, then $z \in \text{Lim sup} z_i$. 

We introduce two new definitions of vector topologically pseudomonotonicity which play a central role in our main results.

**Definition 2.2.** Let \((X, \sigma_1)\) and \((Y, \sigma_2)\) be two Hausdorff topological spaces, let \(f : X \times Y \times X \to Z\) be a trifunction. Then \(f\) is said to be of class \((SPM_1)\) if for every \(u \in X\), \(w \in \text{Int } C\) and for each net \((x_i, y_i)_{i \in I}\) in \(X \times Y\) satisfying \((x_i, y_i) \xrightarrow{\sigma_1,\sigma_2} (x, y) \in X \times Y\) (i.e., \((x_i) \xrightarrow{\sigma_1} x \in X\) and \((y_i) \xrightarrow{\sigma_2} y \in Y\)) and

\[
\liminf f(x_i, y_i, x) \cap (\text{Int } C) = \emptyset,
\]

there is \(j_0 \in I\) such that

\[
\{f(x_i, y_i, u) : i \geq j\} \subset f(x, y, u) + w - \text{Int } C
\]

for all \(j \geq j_0\).

**Definition 2.3.** Let \((X, \sigma_1)\) and \((Y, \sigma_2)\) be two Hausdorff topological spaces, let \(f : X \times Y \times X \to Z\) be a trifunction. Then \(f\) is said to be of class \((SPM_2)\) if for every \(u \in X\), \(w \in \text{Int } C\) and for each net \((x_i, y_i)_{i \in I}\) in \(X \times Y\) satisfying \((x_i, y_i) \xrightarrow{\sigma_1,\sigma_2} (x, y) \in X \times Y\) and

\[
\liminf f(x_i, y_i, x) = \emptyset \quad \text{or} \quad \liminf f(x_i, y_i, x) \cap (\text{Int } C)^c \neq \emptyset,
\]

there is \(j_0 \in I\) such that

\[
\{f(x_i, y_i, u) : i \geq j\} \subset f(x, y, u) + w - \text{Int } C
\]

for all \(j \geq j_0\).

The Definition 2.2 is a slight generalization of the notion of vector topological pseudomonotonicity given by Chiang, Chadli and Yao in [7].

The above definitions represents extensions to a vector framework of the classical pseudomonotonicity notion introduced by Brézis [4].

**Remark 2.4.** Every function of class \((SPM_2)\) is a function of class \((SPM_1)\). The inverse relation does not take place in generally.

**Example 2.5.** Let the \(T : X \to 2^Y\) set-valued be defined by \(T(x) = \{1\}\) for every \(x \in X\), and real vector function \(f : X \times Y \times X \to \mathbb{R}^2\), where \(X = [0, 1]\) and \(Y = [0, 1]\) given with

\[
f(x, y, u) = \begin{cases} 
(yx - u, y - x) & \text{if } x > 0, \\
(u, y) & \text{if } x = 0,
\end{cases}
\]

where the ordering cone \(C\) of \(\mathbb{R}^2\) is the third quadrant, i.e.,

\[
C = \{(x_1, x_2) \in \mathbb{R}^2 : x_1 \leq 0, \ x_2 \leq 0\}.
\]
The function \( f \) is of class \((SPM_1)\), but is not belonging to the class \((SPM_2)\). Indeed, if we make the substitutions, the example become Example 7 in [14].

Let us consider \( \sigma_1 \) and \( \tau \) two topologies on \( X \). Suppose that \( \tau \) is stronger than \( \sigma_1 \) on \( X \).

For the parametric domains in \((GVEP)_p\) we shall use a slight generalization of Mosco’s convergence [11].

**Definition 2.6 ([3, Definition 2.2]).** Let \( K_p \) be subsets of \( X \) for all \( p \in P \). The sets \( K_p \) converge to \( K_{p_0} \) in the Mosco sense \( (K_p \xrightarrow{M} K_{p_0}) \) as \( p \to p_0 \) if:

- i) for every subnet \( (x_{p_i})_{i \in I} \) with \( x_{p_i} \in K_{p_i}, p_i \to p_0 \) and \( x_{p_i} \xrightarrow{\sigma_1} x \) imply \( x \in K_{p_0}; \)
- ii) for every \( x \in K_{p_0}, \) there exist \( x_{p_i} \in K_p \) such that \( x_{p_i} \xrightarrow{\tau} x \) as \( p \to p_0. \)

### 3. CLOSEDNESS OF THE SOLUTION MAP

This section is devoted to prove the closedness of the solution map for parametric generalized vector equilibrium problems with trifunctions.

**Theorem 3.1.** Let \( X \) and \( (Y, \sigma_2) \) Hausdorff topological spaces, the space \( X \) is endowed with two topologies \( \sigma_1 \) and \( \tau \), where \( \sigma_1 \subseteq \tau \). Let \( K_p \) be nonempty sets of \( X \) and let \( p_0 \in P \) be fixed. Suppose that \( S(pt) \neq \emptyset \) for each \( p \in P \) and the following conditions hold:

- i) \( K_p \xrightarrow{M} K_{p_0} \) as \( p \) tends to \( p_0; \)
- ii) for each net of elements \((p_i,(x_{p_i},y_{p_i})) \) in \( \text{Graph} S \), if \( p_i \to p_0, (x_{p_i},y_{p_i}) \xrightarrow{\sigma_1,\sigma_2} (x,y), \) \( u_{p_i} \in K_{p_i}, u \in K_{p_0}, \) and \( u_{p_i} \xrightarrow{\tau} u \) then
  
  \[ \liminf (f_{p_i}(x_{p_i},y_{p_i},u_{p_i}) - f_{p_0}(x_{p_i},y_{p_i},u)) \cap (-\text{Int} \ C) \neq \emptyset, \]

where \( y_{p_i} \in T(x_{p_i}); \)
- iii) \( T : X \to 2^Y \) is closed at \( x; \)
- iv) \( f_{p_0} : X \times Y \times X \to Z \) is of class \((SPM_1)\).

Then the solution map \( p \to S(p) \) is closed at \( p_0, \) i.e., for each net of elements \((p_i,(x_{p_i},y_{p_i})) \) in \( \text{Graph} S, p_i \to p_0 \) and \((x_{p_i},y_{p_i}) \xrightarrow{\sigma_1,\sigma_2} (x,y) \) imply \((p_0,(x,y)) \) in \( \text{Graph} S. \)

**Proof.** Let \((p_i,(x_{p_i},y_{p_i}))_{i \in I} \) be a net of elements \((p_i,(x_{p_i},y_{p_i})) \in \text{Graph} S, \) i.e.,

\[ f_{p_i}(x_{p_i},y_{p_i},u) \in (-\text{Int} \ C)^{C}, \quad \forall u \in K_{p_i}, \]

with \( p_i \to p_0 \) and \((x_{p_i},y_{p_i}) \xrightarrow{\sigma_1,\sigma_2} (x,y). \) By the Mosco convergence of the sets \( K_{p_i}, \) we get \( x \in K_{p_0}. \) Moreover, there exists a net \((u_{p_i})_{i \in I}, u_{p_i} \in K_{p_i} \) such
that \( u_{p_i} \xrightarrow{\tau} x \). From the assumption ii) we obtain that
\[
\liminf (f_{p_i}(x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0}(x_{p_i}, y_{p_i}, x)) \cap (-\text{Int } C) \neq \emptyset.
\]
Since \( -\text{Int } C \) is an open cone, it follows that there exists a subnet \((x_{p_i}, y_{p_i})_{i \in I}\), denoted by the same indexes, such that
\[
(3.2) \quad f_{p_i}(x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0}(x_{p_i}, y_{p_i}, x) \in -\text{Int } C, \quad \forall i \in I.
\]
By replacing \( u \) with \( u_{p_i} \) in (3.1) we get
\[
(3.3) \quad f_{p_i}(x_{p_i}, y_{p_i}, u_{p_i}) \in (-\text{Int } C)^c.
\]
From (3.2) and (3.3) we obtain that
\[
(3.4) \quad f_{p_0}(x_{p_i}, y_{p_i}, x) \in (-\text{Int } C)^c, \quad \text{for all } i \in I.
\]
Since \((-\text{Int } C)^c\) is closed, it follows
\[
\liminf f_{p_0}(x_{p_i}, y_{p_i}, x) \subset (-\text{Int } C)^c.
\]
Now we can apply iv) and we obtain that for every \( u \in K_{p_0}, w \in \text{Int } C \), there exists \( j_1 \in I \) such that
\[
(3.5) \quad \{f_{p_0}(x_{p_i}, y_{p_i}, u) : i \geq j\} \subset f_{p_0}(x, y, u) + w - \text{Int } C, \quad \forall j \geq j_1,
\]
where \( y \in T(x) \) which is true since \( y_i \in T(x_i) \) and \( T \) is closed at \( x \).

We have to prove that
\[
f_{p_0}(x, y, u) \in (-\text{Int } C)^c, \quad \forall u \in K_{p_0}.
\]
Assume the contrary, that there exists \( \overline{u} \in K_{p_0} \) such that
\[
f_{p_0}(x, y, \overline{u}) \in -\text{Int } C.
\]
Let be \( f_{p_0}(x, y, \overline{u}) = -w \) where \( w \in \text{Int } C \). From (3.4) we obtain that there exists \( j_1 \in I \) such that
\[
(3.6) \quad \{f_{p_0}(x_{p_i}, y_{p_i}, \overline{u}) : i \geq j\} \subset -w + w - \text{Int } C = -\text{Int } C, \quad \forall j \geq j_1.
\]
Since \( \overline{u} \in K_{p_0} \) from the Mosco convergence of the sets \( K_{p_i} \) there exists \((\overline{u}_{p_i})_{i \in I} \subset K_{p_i}\) such that \( \overline{u}_{p_i} \xrightarrow{\tau} \overline{u} \). By using again the assumption ii), it follows that there exists a subnet \((x_{p_i}, y_{p_i})_{i \in I}\), denoted by the same indexes, for which
\[
(3.7) \quad f_{p_i}(x_{p_i}, y_{p_i}, \overline{u}_{p_i}) - f_{p_0}(x_{p_i}, y_{p_i}, \overline{u}) \in -\text{Int } C, \quad \text{for all } i \in I.
\]
From (3.5) and (3.6) it follows that
\[
f_{p_i}(x_{p_i}, y_{p_i}, \overline{u}_{p_i}) \in -\text{Int } C, \quad i \in I,
\]
contradicting (3.1). Hence \((p_0, (x, y)) \in \text{Graph } S \). \( \square \)
Remark 3.2. The Theorem 3.1 generalizes the Theorem 3.1 in [12] but it does not imply the Theorem 1 in [3] since the assumption ii) cannot be replaced by

\[ \text{i)} \text{ For each net of elements } (p_i, (x_{p_i}, y_{p_i})) \in \text{Graph } S, \text{ if } p_i \to p_0, (x_{p_i}, y_{p_i}) \]
\[ \sigma_{\sigma_2} \xrightarrow{} (x, y), \ u_{p_i} \in K_{p_i}, \ u \in K_{p_0}, \ \text{and } u_{p_i} \xrightarrow{} u \text{ then} \]
\[ \text{Lim inf} (f_{p_i} (x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0} (x_{p_i}, y_{p_i}, u)) \cap (-C) \neq \emptyset. \]

If we replace the assumption ii) with ii') we have to give a stronger condition to assumption iv).

Theorem 3.3. Let \( X \) and \((Y, \sigma_2)\) Hausdorff topological spaces, the space \( X \) is endowed with two topologies \( \sigma_1 \) and \( \tau \), where \( \sigma_1 \subseteq \tau \). Let \( K_p \) be nonempty sets of \( X \) and let \( p_0 \in P \) be fixed. Suppose that \( S (p) \neq \emptyset \) for each \( p \in P \) and the following conditions hold:

i) \( K_p \xrightarrow{\text{Lim}} K_{p_0} \) as \( p \) tends to \( p_0 \);

ii) for each net of elements \((p_i, (x_{p_i}, y_{p_i})) \in \text{Graph } S, \text{ if } p_i \to p_0, (x_{p_i}, y_{p_i}) \]
\[ \sigma_{\sigma_2} \xrightarrow{} (x, y), \ u_{p_i} \in K_{p_i}, \ u \in K_{p_0}, \ \text{and } u_{p_i} \xrightarrow{} u \text{ then} \]
\[ \text{ Lim inf} (f_{p_i} (x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0} (x_{p_i}, y_{p_i}, u)) \cap (-C) \neq \emptyset, \]

where \( y_{p_i} \in T (x_{p_i}); \)

iii) \( T : X \to 2^I \) is closed at \( x; \)

iv) \( f_{p_0} : X \times Y \times X \to Z \) is of class \((SPM_2)\).

Then the solution map \( p \to S (p) \) is closed at \( p_0 \).

Proof. The proof is given in the following three steps.

Step 1. Let \((p_i, (x_{p_i}, y_{p_i}))_{i \in I} \) be a net of elements \((p_i, (x_{p_i}, y_{p_i})) \in \text{Graph } S, \)

i.e.,

\[ f_{p_i} (x_{p_i}, y_{p_i}, u) \in (-\text{Int } C)^c, \ \forall u \in K_{p_i}, \]

with \( p_i \to p_0 \) and \((x_{p_i}, y_{p_i}) \xrightarrow{\sigma_{\sigma_2}} (x, y) \). By the Mosco convergence of the sets \( K_{p_i} \) we get \( x \in K_{p_0} \). Moreover, there exists a net \((u_{p_i})_{i \in I}, u_{p_i} \in K_{p_i}, \) such that \( u_{p_i} \xrightarrow{} x \). From the assumption ii) we obtain that

\[ \text{Lim inf} (f_{p_i} (x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0} (x_{p_i}, y_{p_i}, u)) \cap (-C) \neq \emptyset. \]

Step 2. We will prove that (3.8) and (3.7) imply

\[ \text{Lim inf} f_{p_0} (x_{p_i}, y_{p_i}, x) = \emptyset \quad \text{or} \quad \text{Lim inf} f_{p_0} (x_{p_i}, y_{p_i}, x) \cap (-\text{Int } C)^c \neq \emptyset. \]

For this we can distinguish two cases:

Case 1. \( \text{Lim inf} (f_{p_i} (x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0} (x_{p_i}, y_{p_i}, x)) \cap (-\text{Int } C) \neq \emptyset. \)

Since \(-\text{Int } C\) is an open cone, it follows that there exists a subnet, denoted by the same indexes, such that

\[ f_{p_i} (x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0} (x_{p_i}, y_{p_i}, x) \in -\text{Int } C, \ \text{for all } i \in I. \]
By replacing $u$ with $u^p_i$ in (3.7) we get
\begin{equation}
(3.10) \quad f_p(x_p, y_p, u_p) \in (- \text{Int} \, C)^c.
\end{equation}
From (3.10) and (3.9) we obtain that
\[ f_p(x_p, y_p, x) \in (- \text{Int} \, C)^c, \text{ for all } i \in I. \]
Since $(- \text{Int} \, C)^c$ is closed, it follows
\[ \liminf f_p(x_p, y_p, x) \in (- \text{Int} \, C)^c. \]
consequently
\[ \liminf f_p(x_p, y_p, x) = \emptyset \quad \text{or} \quad \liminf f_p(x_p, y_p, x) \cap (- \text{Int} \, C)^c \neq \emptyset. \]

\textbf{Case 2.} \quad \liminf (f_p(x_p, y_p, u_p) - f_p(x_p, y_p, x)) \cap (- \text{Int} \, C) = \emptyset.

We can suppose that
\begin{equation}
(3.11) \quad f_p(x_p, y_p, u_p) - f_p(x_p, y_p, x) \in (- \text{Int} \, C)^c, \quad \forall i \in I
\end{equation}
and
\begin{equation}
(3.12) \quad f_p(x_p, y_p, x) \in - \text{Int} \, C, \quad \forall i \in I
\end{equation}
otherwise we get back the first case.

Since $\liminf (f_p(x_p, y_p, u_p) - f_p(x_p, y_p, x)) \cap (- \text{Int} \, C) = \emptyset$, from (3.8) and (3.11) it follows that, there exists a subnet $(x_p, y_p)$, denoted by the same indexes, for which
\begin{equation}
(3.13) \quad (f_p(x_p, y_p, u_p) - f_p(x_p, y_p, x))_{i \in I} \text{ converges to the boundary of cone } - C.
\end{equation}
Indeed, otherwise it must exist $i_0 \in I$ such that
\[ \{f_p(x_p, y_p, u_p) - f_p(x_p, y_p, x) : i \geq i_0\} \subset (-C)^c \]
then from the definition of the limit inferior, we obtain that
\[ \liminf (f_p(x_p, y_p, u_p) - f_p(x_p, y_p, x)) \subset (-C)^c, \]
which is in contradiction with assumption ii').

From (3.12) and (3.13) we obtain that there exists a subnet $(x_p, y_p)$, denoted by the same indexes, such that
\begin{equation}
(3.14) \quad (f_p(x_p, y_p, x))_{i \in I} \text{ converges to an element in the boundary of the cone } - C.
\end{equation}
To prove this statement, let us suppose the contrary, that
\[ \{f_p(x_p, y_p, x) : i \in I\} \subset \text{Int} \, C. \]
Then from (3.13) we obtain that
\[ f_p(x_p, y_p, u_p) \text{ converges to an element in } - \text{Int} \, C. \]
Since $-\text{Int } C$ is an open cone, it follows that there exists $i_1 \in I$ such that
\[ f_{p_i}(x_{p_i}, y_{p_i}, u_{p_i}) \in -\text{Int } C, \text{ for all } i \geq i_1, \]
contradicting (3.7).

By applying the Theorem 2.1 for the subnet in (3.14) we obtain that
\[ \liminf f_{p_0}(x_{p_i}, y_{p_i}, x) \cap (-\partial C) \neq \emptyset, \]
or there exists $i_2 \in I$ such that
\[ \inf \{ f_{p_0}(x_{p_i}, y_{p_i}, x) : i \geq i_2 \} = \emptyset. \]
This implies that
\[ \liminf f_{p_0}(x_{p_i}, y_{p_i}, x) \cap (-\text{Int } C) \neq \emptyset \]
or \[ \liminf f_{p_0}(x_{p_i}, y_{p_i}, x) = \emptyset. \]
So, in both cases, we can apply iv) and we obtain that for every $u \in K_{p_0}$ and $w \in \text{Int } C,$ there exists $j_0 \in I$ such that
\[ \{ f_{p_0}(x_{p_i}, y_{p_i}, u) : i \geq j \} \subset f_{p_0}(x, y, u) + w - \text{Int } C, \forall j \geq j_0, \]
where $y \in T(x)$ which is true since $y_i \in T(x_i)$ and $T$ is closed at $x.$

Step 3. We have to prove that
\[ f_{p_0}(x, y, u) \in (-\text{Int } C)^c, \text{ } \forall u \in K_{p_0}. \]
Assume the contrary, that there exists $\pi \in K_{p_0}$ such that
\[ f_{p_0}(x, y, \pi) \in -\text{Int } C. \]
Let be $f_{p_0}(x, y, \pi) = -w$ where $w \in \text{Int } C.$ From (3.15) we obtain that there exists $j_0 \in I$ such that
\[ \{ f_{p_0}(x, y, i, \pi) : i \geq j \} \subset -w + w - \text{Int } C = -\text{Int } C, \forall j \geq j_0. \]
Since $\pi \in K_{p_0}$ from the Mosco convergence of the sets $K_{p_i},$ we have that there exists $(\pi_{p_i})_{i \in I} \subset K_{p_i}$ such that $\pi_{p_i} \rightarrow \pi.$ By using again the assumption ii'), it follows that one of the next cases, corresponding to (3.9) and (3.13) respectively, hold: there exists a subnet $(x_{p_i}, y_{p_i})$, denoted by the same indexes, such that
\[ f_{p_i}(x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0}(x_{p_i}, y_{p_i}, \pi_{p_i}) \in -\text{Int } C, \forall i \in I \]
or there exists a subnet $(x_{p_i}, y_{p_i})$, denoted by the same indexes, for which
\[ (f_{p_i}(x_{p_i}, y_{p_i}, u_{p_i}) - f_{p_0}(x_{p_i}, y_{p_i}, \pi_{p_i}))_{i \in I} \text{ converges to the boundary of cone } -C. \]
From (3.16), (3.17) and (3.18) it follows that there exists $j_1 \in I$ such that
\[ f_{p_i}(x_{p_i}, y_{p_i}, \pi_{p_i}) \in -\text{Int } C, \forall i \geq j_1 \geq j_0. \]
but on other side \((p_i, (x_{p_i}, y_{p_i})) \in \text{Graph} \, S\), and
\[
\mathbf{f}_{p_i} (x_{p_i}, y_{p_i}, \Omega_{p_i}) \in (- \text{Int} \, C)^c
\]
which is a contradiction. Hence \((p_0, (x, y)) \in \text{Graph} \, S\).  

\[\square\]

**Remark 3.4.** Theorem 3.3 implies Theorem 1 in [3] and Theorem 10 in [14].

**Example 3.5.** Let \(\sigma_1 = \sigma_2 = \tau\) be the natural topology on \(X = Y = [0, 1]\). Let \(P = \mathbb{N} \cup \{\infty\}\), \(p_0 = \infty\), \((\infty\) means \(+\infty\) from real analysis), \(K_n = (0, 1)\), \(n \in \mathbb{N}\) and \(K_\infty = [0, 1]\). On \(P\) we consider the topology induced by the metric \(d\) given by \(d(m, n) = |1/m - 1/n|\), \(d(n, \infty) = d(\infty, n) = 1/n\), for \(m, n \in \mathbb{N}\), and \(d(\infty, \infty) = 0\). Let us consider the third quadrant as the ordering cone \(C\) in \(\mathbb{R}^2\). The multi-valued mapping \(T : X \to 2^Y\) be defined by \(T(x) = [0, 1]\) for every \(x \in X\).

Let the real vector functions \(f_n : [0, 1] \times [0, 1] \times [0, 1] \to \mathbb{R}^2\) be given by \(f_n(x, y, u) = (x - u - 1/n, 1 + x + y)\), \(n \in \mathbb{N}\) and the function \(f_\infty : [0, 1] \times [0, 1] \to \mathbb{R}^2\) be defined by \(f_\infty(x, y, u) = (x - 2u, 2x + y + u)\).

The function \(f_\infty\) is of class \((SPM_2)\), since it is continuous. The mapping \(T\) is closed at each \(x\) from \(X\).

Only the assumption ii’ has to be verified. Let \(x_n, u_n \in (0, 1)\), \(x_n \to x\) and \(u_n \to u\). One has
\[
\liminf (f_n (x_n, y_n, u_n) - f_\infty (x_n, y_n, u)) = \liminf \left\{ (-1/n - u_n + 2u, 1 - x_n - u) , \ n \geq 1 \right\} ,
\]
by Theorem 2.1 it follows that
\[
(u, 1 - x - u) \in \liminf (f_n (x_n, y_n, u_n) - f_\infty (x_n, y_n, u)) .
\]
The \(S(n) = \{(x, y) \in (0, 1) \times [0, 1] : x \in (0, 1/n]\}\) for each \(n \in \mathbb{N}\). Since \(1 + x + y > 0\) we obtain that
\[
x - u - 1/n \geq 0 \text{ for every } u \in (0, 1)\]
from where it follows \(x \in (0, 1/n]\). Hence every sequence \((x_n)\) satisfying \((n, (x_n, y_n)) \in \text{Graph} \, S\) has to converge to \(x = 0\). From \((u, 1 - u) \in - \text{Int} \, C\) it follows that the assumption ii’ takes place. By Theorem 3.3 we obtain that the solution mapping \(S\) is closed at \(\infty\).

4. HADAMARD WELL-POSEDNESS

Let us recall some classical definitions from set-valued analysis. Let \(X, Y\) be topological spaces. The map \(T : X \to 2^Y\) is said to be upper semi-continuous at \(u_0 \in \text{dom} \, T := \{u \in X \mid T(u) \neq \emptyset\}\) if for each neighborhood \(V\) of \(T(u_0)\), there exists a neighborhood \(U\) of \(u_0\) such that \(T(U) \subseteq V\).
Closedness and upper semi-continuity of a multifunction are closely related.

**Proposition 4.1** ([2, Proposition 1.4.8, 1.4.9]). Let \( T : X \to 2^Y \) be a set-valued map.

i) If \( T \) has closed values and is upper semi-continuous then \( T \) is closed.

ii) If \( Y \) is compact and \( T \) is closed at \( x \in X \) then \( T \) is upper semi-continuous at \( x \in X \).

Now we recall the notion of generalized Hadamard well-posedness.

**Definition 4.2.** Let \((X, \sigma_1)\) and \((Y, \sigma_2)\) be two Hausdorff topological spaces. The problem \((GVEP)_p\) is said to be Hadamard well-posed (briefly, H-wp) at \( p_0 \in P \) if \( S(p_0) = \{(x_{p_0}, y_{p_0})\} \) and for any \((x_p, y_p) \in S(p)\) one has \( (x_p, y_p) \xrightarrow{\sigma_1, \sigma_2} (x_{p_0}, y_{p_0}) \) as \( p \to p_0 \). The problem \((GVEP)_p\) is said to be generalized Hadamard well-posed (briefly, gH-wp) at \( p_0 \in P \) if \( S(p_0) \neq \emptyset \) and for any \((x_p, y_p) \in S(p)\), if \( p \to p_0 \), \((x_p, y_p)\) must have a subsequence \((\sigma_1, \sigma_2)\)-converging to an element of \( S(p_0) \).

With the help of the next result we are able to establish the relationship between upper semi-continuity and Hadamard well-posedness.

**Proposition 4.3** ([15, Theorem 2.2]). Let \( T : X \to 2^Y \) be a set-valued map. If \( T \) is upper semi-continuous at \( x \in X \) and \( T(x) \) is compact, then \( T \) is gH-wp at \( x \).

In the following we prove that the solution map of \((GVEP)_p\) has closed value at \( p_0 \).

**Proposition 4.4.** Let \( K_{p_0} \) be closed with respect to the \( \sigma_1 \) topology and \( T : X \to 2^Y \) be a closed set-valued map. If \( f_{p_0} : X \times Y \times X \to Z \) is of class \((SPM_1)\), then \( S(p_0) \) is closed with respect to the \((\sigma_1, \sigma_2)\) topology pair.

**Proof.** Let \( S(p_0) \neq \emptyset \) and \((x_i, y_i) \in S(p_0)\), with \((x_i, y_i) \xrightarrow{\sigma_1, \sigma_2} (x, y)\). Since \( K_{p_0} \) is closed with respect to the \( \sigma_1 \) topology, we have \( x \in K_{p_0} \). From \((x_i, y_i) \in S(p_0)\) it follows that

\[
  f_{p_0}(x_i, y_i, x) \in (-\text{Int } C)^c, \quad \forall i \in I.
\]

Since \((-\text{Int } C)^c\) is closed, we get

\[
  \liminf f_{p_0}(x_i, y_i, x) \in (-\text{Int } C)^c.
\]

By using that \( f_{p_0} \) is of class \((SPM_1)\) we obtain that for every \( w \in \text{Int } C \) there is \( j_0 \) in the index set \( I \) such that

\[
  f_{p_0}(x_i, y_i, u) : i \geq j \subset f(x, y, u) + w - \text{Int } C, \quad \forall j \geq j_0, \forall u \in K_{p_0}.
\]
We have to prove that \((x, y) \in S(p_0)\), i.e.,
\[ f_{p_0}(x, y, u) \in (-\text{Int } C)^c, \quad \forall u \in K_{p_0}. \]
Assume the contrary, that there exists \(\pi \in K_{p_0}\) such that
\[ f_{p_0}(x, y, \pi) \in -\text{Int } C. \]
Let \(f_{p_0}(x, y, \pi) = -w\) where \(w \in \text{Int } C\). From (4.1) we obtain that
\[ \{f_{p_0}(x_i, y_i, \pi) : i \geq j\} \subset -w + w - \text{Int } C = -\text{Int } C, \quad \forall j \geq j_0 \]
which is a contradiction to \((x_i, y_i) \in S(p_0)\). Thus \((x, y) \in S(p_0)\). □

Now we can formulate the following results.

**Corollary 4.5.** Let \((X, \sigma_1)\) be a compact Hausdorff topological space and \(P\) be a Hausdorff topological space. Let \(K_p\) be nonempty sets of \(X\), and \(K_{p_0}\) be a closed subset of \(X\). If the hypotheses of Theorem 3.1 are satisfied, then \((GVEP)_p\) is generalized Hadamard well-posed at \(p_0\). Furthermore, if \(S(p_0) = \{(x, y)\}\) (a singleton), then \((GVEP)_p\) is Hadamard well-posed at \(p_0\).

**Proof.** From Theorem 3.1 we obtain that the solution map \(S\) is closed at \(p_0\). By using Proposition 4.1 ii) it follows that \(S\) is upper semi-continuous at \(p_0\). The set \(S(p_0)\) is closed by Proposition 4.4, hence it is compact. The conclusion follows from Proposition 4.3. □

From Remark 2.4 and Corollary 4.5 we obtain:

**Corollary 4.6.** Let \((X, \sigma_1)\) be a compact Hausdorff topological space and \(P\) be a Hausdorff topological space. Let \(K_p\) be nonempty sets of \(X\) and \(K_{p_0}\) be a closed subset of \(X\). If the hypotheses of Theorem 3.3 are satisfied, then \((GVEP)_p\) is generalized Hadamard well-posed at \(p_0\). Furthermore, if \(S(p_0) = \{(x, y)\}\) (a singleton), then \((GVEP)_p\) is Hadamard well-posed at \(p_0\).
